Figure: Patient portal dashboard for normal registered users.

The screenshot shows the 'My Patient Profile' form. The sidebar is identical to the previous screenshot. The main content area has a header with the title 'My Patient Profile' and a subtitle 'This profile will be linked to your user login account.' In the top right corner, the user 'Vishwas' is logged in, with a 'Logout' button. The form contains the following fields: 'Full Name' (text input with value 'Vishwas'), 'Email' (text input with value 'vishwas@gmail.com'), 'Phone Number' (text input with value '1234567899'), 'Date of Birth' (text input with value '06-06-2008' and a calendar icon), 'Gender' (dropdown menu with value 'Male'), 'Blood Group' (text input with value 'O'), and 'Address' (text input with value 'Address'). At the bottom of the form are two buttons: 'Save Profile' and 'Back'. A small location pin icon is visible in the bottom right corner of the address field.

Figure: Analytics report generated from SQL views and reporting queries.

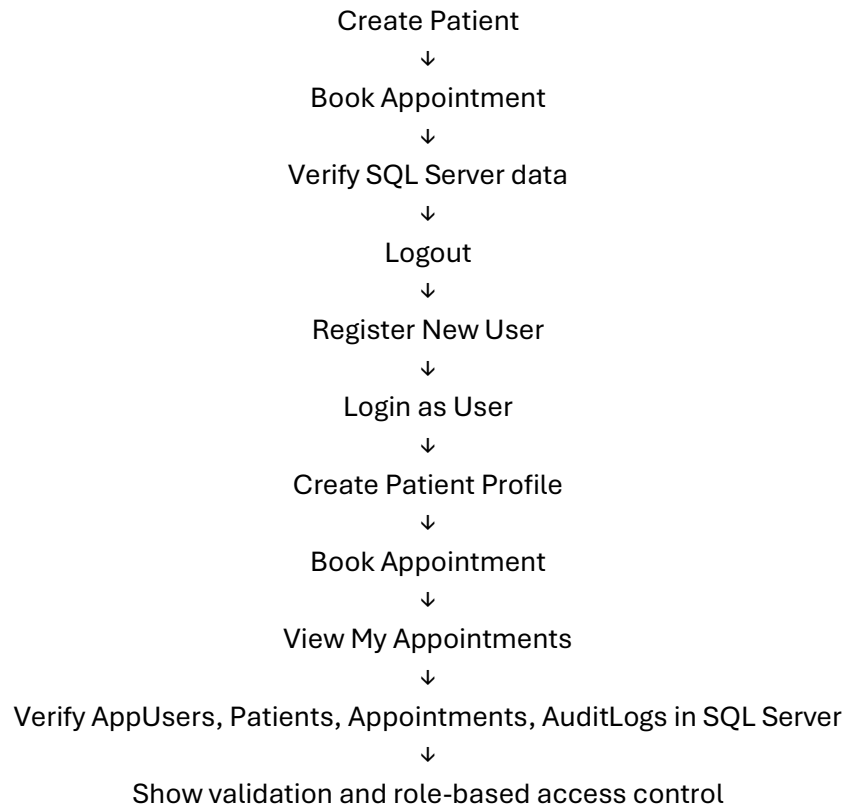

Tested the MVC application from UI to database. First, I started the Healthcare.MVC project and opened the browser portal. I logged in as the seeded admin user and verified the dashboard, patients page, appointments page, and analytics reports. Then I created a patient and booked an appointment through MVC forms. I verified the inserted patient and appointment records directly in SQL Server.

Next, I tested the normal user flow. I registered a new user, logged in through the patient portal, created a patient profile, and booked an appointment. The system linked the AppUsers table to the Patients table using PatientId, so the logged-in user can view only their own appointments. I also tested validation, invalid login, and role-based access control to confirm that normal users cannot access admin pages.

Final MVC Demo Flow

Use this exact flow during your final demo:

```
Run MVC project
↓
Open login page
↓
Login as Admin
↓
Show Admin Dashboard
↓
Show Patient List
↓
```

This will clearly shows **UI → Controller → Service → Repository/EF Core → SQL Server** flow.
